We prove a result on Diophantine approximations with Fibonacci numbers. Let $F_0 = 0, F_1 = 1, F_n = F_{n-1} + F_{n-2}$ be Fibonacci numbers.

Define $d_N^K = \max_{\alpha \in \mathbb{R}} \min_{k=K \ldots K+N-1} \|F_k \alpha\|$. Let $\phi$ be the Golden ratio. We prove that

1) $\lim_{N \to \infty} d_N^K = (\phi - 1)/(\phi + 2)$;
2) $\lim_{K \to \infty} d_N^K = 1/5$, for all $N \geq 5$.

The point where $d_N^K$ attains its maximum tends to $\alpha = 1/(\phi + 2)$ in both cases.
